

JALEN ARMS

Software Engineer — Backend & Distributed Systems

jalenarms@outlook.com | (614) 596-8904 | linkedin.com/in/jalen-arms

Backend-focused software engineer building and operating .NET services in production since 2022. Currently work across distributed microservices, service bus messaging, and Elasticsearch-backed search for Carvana's digital wholesale auction platform. Previously built a shelter management platform from the ground up, replacing spreadsheet workflows for a healthcare nonprofit.

SKILLS

Languages C#, TypeScript / JavaScript, Python, SQL, Swift

Backend & Data ASP.NET Core, service bus messaging, event-driven architecture, GraphQL (Hot Chocolate, Fusion), Elasticsearch, SQL and NoSQL (SQL Server, Cosmos DB, Marten), REST APIs, ETL

Frontend React, Blazor / Blazor WASM, Angular, SwiftUI, Tailwind CSS

Platform & Tooling Azure, Azure DevOps, CI/CD, Git, Windows IIS, Xcode

EXPERIENCE

Carvana

December 2025 – Present

Software Engineer

ADESA Clear, Carvana's digital wholesale auction — serving first-party Carvana wholesale inventory and third-party sellers including BMW, Tesla, Chase, and Credit Union Leasing of America.

- **Async data flow** — Work across distributed services that communicate over a service bus, decoupled and independently deployable.
- **Event-driven workflows** — Develop state machine workflows that orchestrate inventory lifecycle transitions and listing creation across those services.
- **Listing automation** — Develop and maintain the .NET microservices that automate daily listing creation for auction inventory.
- **Elasticsearch** — Own the Search API and ingestion pipelines behind vehicle discovery, keeping listings searchable as inventory turns over.
- **GraphQL** — Build Hot Chocolate subgraphs composed through a Fusion gateway, giving client teams one typed endpoint instead of calls to each backing service.
- **Production support** — Diagnose and resolve customer-impacting incidents across distributed services, reducing repeat failures.

Community Bridges, Inc.

March 2023 – Present (part-time since December 2025)

Software Engineer / Data Engineer

- **Shelter management platform** — Built a Clean Architecture .NET Web API and Blazor WASM client from the ground up, replacing the Excel workbooks shelters used to manage clientele and becoming the system of record for HUD-mandated HMIS documentation.
- **Bedboard** — Built a bird's-eye view of full client inventory with drill-in to any client's active bedstay or profile, replacing manual spreadsheet roster reconciliation.
- **Low-code template engine** — Built a configurable templating system that persists new data models from configuration alone, so staff capture new HMIS data points without a redeploy.
- **E-signature capture** — Integrated an iPad ink signature pad with a reusable PDF generator that stamps signatures and initials onto documents, giving shelters audit-ready signed records.
- **HIPAA compliance** — Implemented role-based access control and field-level audit history so client data stays access-scoped and every change is attributable.
- **Python ETL** — Built Task Scheduler pipelines that process billing claim batches and ingest large Excel and CSV datasets into remote SQL Server, removing manual data entry.
- **Blue-green deployment** — Built CI/CD pipelines that run automated tests, deploy to a staging IIS site, then slot-swap between two IIS sites running in tandem, so releases land without downtime and roll back with a swap.

HotSpot

November 2024 – October 2025

Lead iOS Developer

- **SwiftUI migration** — Migrated a UIKit and Storyboard app to SwiftUI, preserving functionality while improving maintainability.
- **Google Maps SDK** — Built an interactive event map with drill-in navigation, making location the app's primary discovery surface.
- **Firebase Functions + OpenAI** — Moved backend logic into scheduled functions that parse inbound event emails and enrich records before import, removing manual event entry.

StarHealth

November 2022 – January 2023

Software Developer

- **Next.js T3 migration** — Migrated to a T3 stack with tRPC for end-to-end type safety and Prisma as ORM, eliminating a class of client/server runtime errors.
- **Schema restructuring** — Restructured the database schema and added views and indexes, improving query performance behind a new directory page with search and filtering over a large record set.

EDUCATION

University of Arizona — Full-Stack Web Development Certificate
