

JALEN ARMS

.NET Engineer — Backend & Distributed Systems

jalenarms@outlook.com | (614) 596-8904 | linkedin.com/in/jalen-arms

.NET software engineer building and operating backend services in production since 2022. Currently work across distributed microservices, Azure Service Bus messaging, and Elasticsearch-backed search for Carvana's digital wholesale auction platform, coordinating across an Agile organization of 8-9 engineering teams. Previously built a shelter management platform from the ground up on a .NET Web API and SQL Server backend, replacing spreadsheet workflows for a healthcare nonprofit.

SKILLS

Languages C#, TypeScript / JavaScript, Python, SQL, Swift

Backend & Data ASP.NET Core, Azure Service Bus, event-driven architecture, GraphQL (Hot Chocolate, Fusion), Elasticsearch, SQL and NoSQL (SQL Server, Cosmos DB, Marten), REST APIs, ETL

Frontend Blazor WASM, JavaScript / TypeScript, HTML, CSS

Platform & Tooling Azure (Container Apps, Blob Storage), Azure DevOps, CI/CD, Application Insights, Splunk, Datadog, Git, Windows IIS, Xcode

Practices Agile / Scrum, sprint planning, cross-team collaboration, production support & on-call

EXPERIENCE

Carvana

December 2025 – Present

Software Engineer

ADESA Clear, Carvana's digital wholesale auction — serving first-party Carvana wholesale inventory and third-party sellers including BMW, Tesla, Chase, and Credit Union Leasing of America.

- **.NET microservices** — Develop and maintain .NET microservices deployed on Azure Container Apps that automate daily listing creation for auction inventory, keeping each service independently deployable.
- **Azure Service Bus** — Coordinate asynchronous communication between distributed .NET services using Azure Service Bus topics and subscriptions, decoupling producers and consumers so each service ships and scales independently.
- **Event-driven architecture** — Design state machine workflows that orchestrate inventory lifecycle transitions and listing creation, publishing domain events that downstream teams' services consume.
- **Elasticsearch** — Own the Search API and Elasticsearch ingestion pipelines behind vehicle discovery, tuning index mappings and queries so listings stay searchable for web and mobile clients as inventory turns over daily.
- **GraphQL** — Compose Hot Chocolate subgraphs through a Fusion gateway, giving client teams one typed GraphQL endpoint instead of separate calls to each backing service.
- **Production support** — Use Azure Application Insights, Splunk, and Datadog to diagnose and resolve customer-impacting incidents across distributed services during on-call rotations, reducing repeat failures.
- **Agile & cross-team coordination** — Participate in daily standups and sprint planning as part of a Scrum team, coordinating with 8-9 other engineering teams to align on API contracts and shared service changes ahead of each release.

Community Bridges, Inc.

March 2023 – December 2025

Software Engineer / Data Engineer

- **.NET Web API & Blazor WASM** — Built a Clean Architecture ASP.NET Core Web API and Blazor WASM client from the ground up, deployed to a remote Windows IIS server, replacing the Excel workbooks shelters used to manage clientele and becoming the system of record for HUD-mandated HMIS documentation.
- **SQL Server** — Queried and aggregated live client and bedstay data from SQL Server into the bedboard, a real-time Blazor WASM dashboard giving staff a bird's-eye view of full client inventory with drill-in to any active bedstay or profile,

replacing manual spreadsheet roster reconciliation.

- **Low-code template engine** — Built a configuration-driven templating system in C# that persists entirely new data models and HMIS fields from metadata alone, so shelter staff capture new documentation requirements without a code change or redeploy.
- **E-signature capture** — Integrated an ePad ink signature pad via its SDK with a reusable PDF generation service in .NET that stamps client signatures and initials onto documents, giving shelters downloadable, audit-ready signed records for HUD compliance reviews.
- **HIPAA compliance** — Implemented role-based access control (RBAC) and field-level audit history in ASP.NET Core so protected client data stays access-scoped by shelter and role, and every change is attributable for HIPAA and HUD audits.
- **Python ETL** — Built Python ETL pipelines scheduled through Windows Task Scheduler that process monthly billing claim batches and ingest large Excel and CSV datasets into SQL Server, removing manual data entry from the billing cycle.
- **Blue-green deployment** — Built CI/CD pipelines that run automated tests, deploy to a staging Windows IIS site, then slot-swap between two IIS servers running in tandem, so releases to the remote production server land without downtime and roll back with a swap.

HotSpot

November 2024 – October 2025

Lead iOS Developer

- **SwiftUI migration** — Migrated a UIKit and Storyboard app to SwiftUI, preserving functionality while improving maintainability.
- **Google Maps SDK** — Built an interactive event map with drill-in navigation, making location the app's primary discovery surface.
- **Firebase Functions + OpenAI** — Moved backend logic into scheduled functions that parse inbound event emails and enrich records before import, removing manual event entry.

StarHealth

November 2022 – January 2023

Software Developer

- **Next.js T3 migration** — Migrated to a T3 stack with tRPC for end-to-end type safety and Prisma as ORM, eliminating a class of client/server runtime errors.
- **Schema restructuring** — Restructured the database schema and added views and indexes, improving query performance behind a new directory page with search and filtering over a large record set.

EDUCATION

University of Arizona — Full-Stack Web Development Certificate

2022
